

Copy-and-Paste Redeemed

Towards Adapting Abstractions

Christoph Reichenbach
Goethe University Frankfurt

09 November 2015

based on our ASE 2015 paper with Krishna Narasimhan

Extending DSLs

- ▶ **PQL/Java**: Parallel Query Language for Java
- ▶ **PQL-ESL**: Extension Specification Language for PQL/Java

Extending DSLs

- ▶ **PQL/Java**: Parallel Query Language for Java
- ▶ **PQL-ESL**: Extension Specification Language for PQL/Java
- ▶ Student Project: Add SQL support via PQL-ESL

Extending DSLs

- ▶ **PQL/Java**: Parallel Query Language for Java
- ▶ **PQL-ESL**: Extension Specification Language for PQL/Java
- ▶ Student Project: Add SQL support via PQL-ESL
 - ▶ BSc student: “Using PQL-ESL abstractions was challenging”
 - ▶ SQL support still not optimal: Differences in SQL implementations would require multiple backends

Extending DSLs

- ▶ **PQL/Java**: Parallel Query Language for Java
- ▶ **PQL-ESL**: Extension Specification Language for PQL/Java
- ▶ Student Project: Add SQL support via PQL-ESL
 - ▶ BSc student: “Using PQL-ESL abstractions was challenging”
 - ▶ SQL support still not optimal: Differences in SQL implementations would require multiple backends
- ▶ **Can we help introduce new abstractions?**
- ▶ **Can we help extend existing abstractions?**

Duplication vs. Abstraction

```
int dist(coord a, coord b)
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return std::max(dx, dy);
}
```

Duplication vs. Abstraction

```
int dist(coord a, coord b)
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return std::max(dx, dy);
}

int dist2(coord a, coord b)
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return std::hypot(dx, dy);
}
```

Duplication vs. Abstraction

```
int dist(coord a, coord b)
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return std::max(dx, dy);
}

int dist2(coord a, coord b)
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return std::hypot(dx, dy);
}
```

Alternative: Abstraction

```
int distG(coord a, coord b,
          int (*f)(int, int))
{
    int dx = abs(a.x - b.x);
    int dy = abs(a.y - b.y);
    return f(dx, dy);
}
```

A Small User Study

- ▶ We took a number of near-clones from existing programs
- ▶ We removed one of the clones from each program
- ▶ We asked five C++ programmers (graduate students) to reimplement missing functionality
 - ▶ Experience: 2, 3, 12, 48, 120 months
- ▶ **Abstraction:**
- ▶ **Copy-Paste:**

- ▶ We removed one of the clones from each program
- ▶ We asked five C++ programmers (graduate students) to reimplement missing functionality
 - ▶ Experience: 2, 3, 12, 48, 120 months
- ▶ **Abstraction:** ■
 - ▶ Users tend to prefer abstraction
 - ▶ 12/15 tasks completed in time
 - ▶ Factor 2-3 slower than abstraction
- ▶ **Copy-Paste:** ▲
 - ▶ 15/15 tasks completed in time
 - ▶ Universally faster (except for a single tie)

The Best of Both Worlds

- ▶ Hypothesis: More abstractions $\Rightarrow$ slower programmers
- ▶ However:
 - ▶ Literature on clone research mostly agrees that clones are maintenance problem
 - ▶ Practitioner literature strongly advocates abstraction
- ▶ Choice between:
 - ▶ **Fast development** with copy-paste programming
 - ▶ **Maintainability** with abstraction

The Best of Both Worlds

- ▶ Hypothesis: More abstractions $\Rightarrow$ slower programmers
- ▶ However:
 - ▶ Literature on clone research mostly agrees that clones are maintenance problem
 - ▶ Practitioner literature strongly advocates abstraction
- ▶ Choice between:
 - ▶ **Fast development** with copy-paste programming
 - ▶ **Maintainability** with abstraction
- ▶ Generative Programming perspective:
 - ▶ **Fast development** with generation + manual edits
 - ▶ **Maintainability** by evolving code generators

The Best of Both Worlds

- ▶ Hypothesis: More abstractions $\Rightarrow$ slower programmers
- ▶ However:
 - ▶ Literature on clone research mostly agrees that clones are maintenance problem
 - ▶ Practitioner literature strongly advocates abstraction
- ▶ Choice between:
 - ▶ **Fast development** with copy-paste programming
 - ▶ **Maintainability** with abstraction
- ▶ Generative Programming perspective:
 - ▶ **Fast development** with generation + manual edits
 - ▶ **Maintainability** by evolving code generators

Why not both?

An Example

```
void function1()
{
    fake_db_init(&fakedb, true);
    run_mode = MODE_DEBUG;
    start(&service);
}

void function2()
{
    fake_db_init(&fakedb, false);
    run_mode = MODE_INFO;
    start(&service);
}

void function3()
{
    db_init();
    db_sanity_check();
    run_mode = MODE_REGULAR;
    start(&service);
}
```

An Example

```
void function1()
{
    b(c,d);
    y = f1;
    x(z);
}

void function2()
{
    b(c,e);
    y = f2;
    x(z);
}

void function3()
{
    b2();
    n();
    y = f3;
    x(z);
}
```

An Example

```
void function1()
{
    b(c,d);
    y = f1;
    x(z);
}
```

```
void function2()
{
    b(c,e);
    y = f2;
    x(z);
}
```

```
void function3()
{
    b2();
    n();
    y = f3;
    x(z);
}
```

Automating Abstraction

Automating Abstraction

Automating Abstraction

An Example

```
void function1()
{
    b(c,d);
    y = f1;
    x(z);
}

void function2()
{
    b(c,e);
    y = f2;
    x(z);
}

void function3()
{
    b2();
    n();
    y = f3;
    x(z);
}
```

An Example

```
void function1()
{
    b(c,d);
    y = f1;
    x(z);
}
void function2()
{
    b(c,e);
    y = f2;
    x(z);
}
void function3()
{
    b2();
    n();
    y = f3;
    x(z);
}
```

```
void fnMerged(int functionId,
              int fValue, bool bParam)
{
    if (functionId == 1
        || functionId == 2) {
        b(c, bParam);
    }
    if (functionId == 3) {
        b2();
        n();
    }
    y = fValue;
    x(z);
}
```

An Example

```
void function1()
{
    b(c,d);
    y = f1;
    x(z);
}
void function2()
{
    b(c,e);
    y = f2;
    x(z);
}
void function3()
{
    b2();
    n();
    y = f3;
    x(z);
}
```

```
void fnMerged(int functionId,
              int fValue, bool bParam)
{
    if (functionId == 1
        || functionId == 2) {
        b(c, bParam);
    }
    if (functionId == 3) {
        b2();
        n();
    }
    y = fValue;
    x(z);
}
void function1() {
    fnMerged(1,f1,d);
}
```

Realising Merge Points

- ▶ Merge Points (M) realised via abstraction
- ▶ Different forms of abstraction:
 - ▶ *C++*:
 - ▶ Parameters
 - ▶ Template parameters
 - ▶ Fields
 - ▶ Delegate patterns
 - ▶ Subclasses
 - ▶ Function pointers
 - ...

Realising Merge Points

- ▶ Merge Points (M) realised via abstraction
- ▶ Different forms of abstraction:
 - ▶ *C++*:
 - ▶ Parameters
 - ▶ Template parameters
 - ▶ Fields
 - ▶ Delegate patterns
 - ▶ Subclasses
 - ▶ Function pointers
 - ...
 - ▶ We leave choice of abstraction to user

Realising Merge Points

- ▶ Merge Points (M) realised via abstraction
- ▶ Different forms of abstraction:
 - ▶ *C++*:
 - ▶ **Parameters**
 - ▶ **Template parameters**
 - ▶ Fields
 - ▶ Delegate patterns
 - ▶ Subclasses
 - ▶ **Function pointers**
 - ...
 - ▶ We leave choice of abstraction to user
 - ▶ Implemented as Eclipse plugin for C++ (based on CDT)

Implementing Merges

```
int f1() {  
    return 1;  
}  
  
int f2() {  
    return 2;  
}  
  
void main() {  
    cout << f1() << endl;  
}
```

```
int f(int k) {  
    switch (k) {  
        case 1: return 1;  
        case 2: return 2;  
    }  
}  
  
void main() {  
    cout << f(1) << endl;  
}
```

Implementing Merges

```
int f1() {  
    return 1;  
}  
  
int f2() {  
    return 2;  
}  
  
void main() {  
    cout << f1() << endl;  
}
```

selector channel

```
int f(int k) {  
    switch (k) {  
        case 1: return 1;  
        case 2: return 2;  
    }  
}  
  
void main() {  
    cout << f(1) << endl;  
}
```

formal selector

selection mechanism

actual selector

- ▶ **Selector:** encodes the variant to choose
- ▶ **Selection Mechanism:** translates selector to alternative

Implementing Merges

```
int f1() {  
    return 1;  
}
```

```
int f2() {  
    return 2;  
}
```

```
void main() {  
    cout << f1() << endl;  
}
```

selector channel

formal selector

```
int f(int k) {  
    return k;  
}
```

selection mechanism

```
void main() {  
    cout << f(1) << endl;  
}
```

actual selector

- ▶ **Selector:** encodes the variant to choose
- ▶ **Selection Mechanism:** translates selector to alternative

Selectors and Selection Mechanisms in C++

Selector Channel Types

- ▶ Value Parameter
- ▶ Pointer Parameter
- ▶ Reference Parameter
- ▶ Template Parameter
- ▶ Global Variable
- ▶ Field
- ▶ Dynamic Type
- ▶ UNIX Environment Variable
- ...

Effective as a Refactoring Tool

Lessons for Generative Programming?

Language-Level Abstraction

- ▶ Approach shows that we can automatically introduce abstraction
- ▶ Still need heuristics to choose *abstraction mechanism*
- ▶ Extending existing abstraction also feasible

Lessons for Generative Programming?

Template-based Code Generation

Language-Level Abstraction

- ▶ Approach shows that we can automatically introduce abstraction
- ▶ Still need heuristics to choose *abstraction mechanism*
- ▶ Extending existing abstraction also feasible

Lessons for Generative Programming?

General Metaprogramming & DSLs

Template-based Code Generation

Language-Level Abstraction

- ▶ Approach shows that we can automatically introduce abstraction
- ▶ Still need heuristics to choose *abstraction mechanism*
- ▶ Extending existing abstraction also feasible

Lessons for Generative Programming?

General Metaprogramming & DSLs

Template-based Code Generation

Language-Level Abstraction

- ▶ Approach shows that we can automatically introduce abstraction
- ▶ Still need heuristics to choose *abstraction mechanism*
- ▶ Extending existing abstraction also feasible

Open Question: How do we pick the Actual Selector automatically?

Conclusions

- ▶ Hypothesis: More abstractions $\Rightarrow$ harder for humans to work with
- ▶ Idea: Use automation to
 - ▶ Abstract code after cloning
 - ▶ Specialise abstract code prior to *specialised* modification (*Inline* refactoring)
 - ▶ Merge modification back into abstract code
- ▶ For C++/Eclipse: <https://marketplace.eclipse.org/content/clone-abstractor-c-methods-0>
